Section 1: Follow-Up After Hospitalization for Mental Illness (FUH) Measure Specifications – Version 3.0

Description of Measure

This measure assesses the percentage of inpatient psychiatric facility (IPF) hospitalizations for treatment of select mental health disorders that were followed by an outpatient mental health care encounter. Two rates are reported:

- The percentage of discharges for which the patient received follow-up within 7 days of discharge
- The percentage of discharges for which the patient received follow-up within 30 days of discharge

The measurement period used to identify cases in the denominator is 12 months from July 1, 2017 through June 30, 2018. Data from the start of the measurement period through 30 days after the close of the measurement period are used to identify follow-up visits in the numerator.

As this is a claims-based measure, there is no action required by facilities to collect and submit data for this measure. CMS will calculate the measure rates using Part A and Part B claims data that are received by Medicare for payment purposes. CMS will calculate this measure by linking Medicare fee-for-service (FFS) claims submitted by IPFs and subsequent outpatient providers for Medicare FFS IPF discharges. This approach requires no additional data collection or reporting by IPFs. Completion of this measure does not affect an IPF’s payment determination.

Numerator Statement

This measure estimates the number of discharges from a psychiatric facility that are followed by an outpatient mental health care encounter within 7 and 30 days after discharge. Outpatient mental health care encounters are defined as outpatient visits, intensive outpatient encounters, or partial hospitalizations provided by a mental health provider. An outpatient mental health provider is defined as any of the following types of professionals listed in Table A1. All codes used to identify providers are found in Medicare outpatient/carrier files. Either a Medicare specialty code OR taxonomy code qualifies as a numerator hit. Specialty codes and taxonomy codes are aligned where appropriate with the mental health practitioners defined in the Healthcare Effectiveness Data and Information Set® (HEDIS®) 2018 specifications.

Outpatient visits, intensive outpatient encounters, and partial hospitalizations are defined by the Current Procedural Terminology (CPT), Healthcare Common Procedure Coding System (HCPCS), and Uniform Billing (UB) Revenue codes listed in Table A2. A claim meeting any of the requirements in the table constitutes an outpatient visit.

Denominator Statement

The denominator includes discharges paid under the IPF prospective payment system (PPS) during the measurement period for Medicare FFS patients with a principal diagnosis of mental illness. Specifically, the measure includes IPF discharges (Table A4) for which the patient was:

- Discharged with a principal diagnosis of mental illness that would necessitate follow-up care with a mental health professional.
 - Defined using the ICD-10-CM codes listed in Table A5.
- Discharged alive to ensure they are eligible for follow-up care.
 - Defined as any Discharge Status Code other than “20” (expired).
- Enrolled in Medicare Parts A and B during the month of the discharge date and at least one month after the discharge date to ensure data are available to capture the index admission and follow-up visits.
 - Defined as having continuous (no gaps) Medicare Part A and Part B coverage with no Health Maintenance Organization (HMO). Therefore, the Entitlement Buy-in Indicator must be “3” or “C” and the HMO indicator must be “0” for both the month of discharge and the month following the discharge month for the IPF stay to qualify as continuous FFS.
- Six years of age or older on the date of discharge because follow-up with a mental health professional may not always be recommended for younger children.
 - Defined using date of birth from the CMS Enrollment Data Base (EDB) beneficiary table.

Medicare files are used to identify all exclusions. The denominator excludes IPF discharges for patients:

- Admitted or transferred to acute and non-acute inpatient facilities within the 30-day follow-up period because admission or transfer to other institutions may prevent an outpatient follow-up visit from taking place.
 - Defined using the claim type and codes listed in Table A6. Each facility type must have both a claim type and one of the corresponding CCN, HCPCS, UB, or place of service (POS) codes if they are listed in the row for that facility type.
- Discharged or transferred to other institutions, including direct transfer to a prison, within the 30-day follow-up period because those patients may not have the opportunity for an outpatient follow-up visit.
 - Defined using the discharge codes listed in Table A7.
- Who died during the 30-day follow-up period because patients who expire may not have the opportunity for an outpatient follow-up visit.
 - Defined using the Medicare Enrollment File.
- Who use hospice services or elect to use a hospice benefit any time during the measurement year, regardless of when the services began because patients in hospice may require different follow-up services.
 - Defined using the hospice codes listed in Table A8.

Section 2: 30-Day All-Cause Unplanned Readmission Following Psychiatric Hospitalization in an Inpatient Psychiatric Facility (IPF) Measure Specifications – Version 2.0

Description of Measure

This facility-level measure estimates an unplanned, 30-day, risk-standardized readmission rate for adult Medicare FFS patients with a principal discharge diagnosis of a psychiatric disorder or dementia/Alzheimer’s disease. The measurement period used to identify cases in the measure population is 24 months from July 1, 2016 through June 30, 2018. Data from the start of the measurement period through 30 days after the close of the measurement period are used to identify readmissions. Data from 12 months prior to the start of the measurement period through the measurement period are used to identify risk factors.

Numerator Statement

The risk-adjusted outcome measure does not have a traditional numerator and denominator. The numerator statement describes the outcome being measured. A readmission is defined as any admission, for any reason, to an IPF or a short-stay acute care hospital (including CAHs) that occurs within 30 days after the discharge date from an eligible index admission to an IPF, except those considered planned. The measure uses the CMS 30-day Hospital-Wide Readmission (HWR) Measure Planned Readmission Algorithm, Version 4.0. The planned readmission algorithm follows two principles to identify planned readmissions:

- Select procedures and diagnoses, such as transplant surgery, maintenance chemotherapy/radiotherapy/immunotherapy, rehabilitation, and forceps delivery, are considered always planned (Table B1 and Table B2).
- Some procedures, such as colorectal resection or aortic resection, are considered either planned or unplanned depending on the accompanying principal discharge diagnosis (Table B3). Specifically, a procedure is considered planned if it does not coincide with a principal discharge diagnosis of an acute illness or complication (Table B4).

Denominator Statement

The risk-adjusted outcome measure does not have a traditional numerator and denominator. The denominator statement describes the measure population. The measure population consists of eligible index admissions to IPFs. A readmission within 30-days will also be eligible as an index admission, if it meets all other eligibility criteria. Patients may have more than one index admission within the measurement period.

Index admissions are defined as admissions to IPFs for patients with the following characteristics:

- Age 18 or older at admission
- Discharged alive
- Enrolled in Medicare FFS Parts A and B during the 12 months prior to, the month of, and at least one month after the index admission

- Discharged with a psychiatric principal diagnosis included in one of the Agency for Healthcare Research and Quality (AHRQ) Clinical Classification Software (CCS) ICD groupings in Table B5. (More information on grouping ICD codes into clinically coherent groups is available at the following link: <https://www.hcup-us.ahrq.gov/toolssoftware/ccs/ccs.jsp>.)

Table B5. Principal discharge diagnosis clinical categories designating psychiatric illness for measure cohort

Diagnosis CCS	Description
650	Adjustment disorders
651	Anxiety disorders
652	Attention-deficit, conduct, and disruptive behavior disorders
653	Delirium, dementia, and amnesic and other cognitive disorders
654	Developmental disorders
655	Disorders usually diagnosed in infancy, childhood, or adolescence
656	Impulse control disorders, NEC
657	Mood disorders
658	Personality disorders
659	Schizophrenia and other psychotic disorders
660	Alcohol-related disorders
661	Substance-related disorders
662	Suicide and intentional self-inflicted injury
663	Screening and history of mental health and substance abuse codes
670	Miscellaneous disorders

The measure population excludes admissions for patients with the following characteristics:

- Discharged against medical advice (AMA) because the IPF may have limited opportunity to complete treatment and prepare for discharge
- With unreliable demographic and vital status data defined as the following: Age greater than 115 years
- Missing gender
- Discharge status of “dead” but with subsequent admissions
- Death date prior to admission date
- Death date within the admission and discharge dates but the discharge status was not “dead”
- With readmissions on the day of discharge or day following discharge because those readmissions are likely transfers to another inpatient facility. The hospital that discharges the patient to home or a non-acute care setting is accountable for subsequent readmissions.
- With readmissions two days following discharge because readmissions to the same IPF within two days of discharge are combined into the same claim as the index admission and do not appear as readmissions due to the interrupted stay billing policy. Therefore, complete data on readmissions within two days of discharge are not available.

Statistical Risk Model and Variables

Hierarchical logistic regression is used to estimate a risk standardized readmission rate.

Risk Factor Variables

Four types of risk factors are included in the risk adjustment model:

1. Demographics (Table B6)
 - Principal discharge diagnosis of the IPF index admission (Table B7) Discharge diagnoses were summarized into 13 distinct principal discharge risk factors using a modified version of the AHRQ CCS groupings.
2. Comorbidity risk variables (Table B8)
 - Comorbidities were summarized into 51 distinct psychiatric and non-psychiatric risk factors using a modified version of CMS’s Hierarchical Condition Categories (CC). The comorbidity risk factors are derived from three sources: Secondary diagnoses of the index admission when not considered a potential complication of care.
 - Principal or secondary diagnoses of inpatient encounters during the 12 months prior to the index admission.
 - Primary or secondary diagnoses of outpatient encounters that had evaluation and management (E&M) procedure codes indicating services were provided by physicians or qualified health professionals. To eliminate diagnoses that may have been assigned during diagnostic work up without later confirmation, a minimum of two outpatient claims with a diagnosis in the same CC are required during the 12 months prior to the index admission for inclusion as a risk variable for a given patient.
3. Other risk factor variables among psychiatric patients (Table B9)
 - Other risk factors were summarized into three distinct risk factors using Medicare FFS claims.
